

A What he was handed, and how he handled it

Dashed line: loss rate the yardstick implies. Area: spells. Orange: lost more often than implied. Between-player dispersion in reception difficulty and in retention residuals both exceeds the permutation benchmark.

B Why a raw difficulty difference needs caution

Same spells on both axes. Grey: labels shuffled within match and position group. Observed $r = 0.982$; null mean 0.991, 95% permutation interval [0.988, 0.994].
